No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Description

1 LOCATION: 1..1345

OTHER INFORMATION: /note= "product = Zea mays AP1."

US-09-398-326-7
FILING DATE: 05-UW-1996
ATTORNEY/AGENT INFORMATION:
NAME: Campbell, Cathryn A.
REGISTRATION NUMBER: 31,815
REFERENCE/DOCKET NUMBER: 9-UD 3739
TELEPHONE: (619) 535-8949
INFORMATION FOR SEO ID NO: 7:
SEQUENCE CHARACTERISTICS:
LENGTH: 1345 base pairs
TYPE: nucleic acid
STRANDEDNESS: double
TOPOLOGY: linear
MOLECULE TYPE: CDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CURRENT APPLICATION DATA:

REGISTRATION NUMBER: 31,815
REFERENCE/LOCKET NUMBER: 31,815
REFERENCE/LOCKET NUMBER: 9-UD 1927
TELEPHONE: (619) 535-9001
TELEPHONE: (619) 535-8949
INFORMATION FOR SEQ ID NO: 9:
SEQUENCE CHARACTERISTICS:
LENGTH: 779 base pairs
TYPE: nucleic acid
STRANDEDNESS: double
REFERENCE/DOCKET NUMBER: 4630-47071
TELECOMMUNICATION INFORMATION:
TELEPHONE: (503) 226-7391
TELEFAX: (503) 226-9446
INFORMATION FOR SEQ ID NO: 10:
SEQUENCE CHARACTERISTICS:
LENGTH: 945 base pairs
TYPE: nucleic acid
TYPE: nucleic acid
STRANDENESS: double stranded

Granny Smith apple; MdAP3; seedless fruit; horticulture; accelerated breeding programme; cross pollination; transgenic plant; biennial bearing tendency; codling moth; ss. Granny Smith apple cDNA encoding MdAP3.

Malus x domestica; var. Granny Smith. Location/Qualifiers Key

(HORT-) HORTICULTURE & FOOD RES INST NEW ZEALAND. 1. .699 /*tag= a /product= "MdAP3" 07-SEP-2000; 2000WO-NZ000176. 99NZ-00337688. WPI; 2001-235145/24. P-PSDB; AAU00187. Yao J, Morris BA; WO200117334-A1 07-SEP-1999; 15-MAR-2001.

New genetically modified fruiting plants that does not functionally express MdPI or MdAP3 peptides, useful for producing seedless fruits, specifically apple and its related species.

Claim 17; Fig 6; 41pp; English.

The sequence encodes Granny Smith apple MdAP3. The invention concerns a fruiting plant that has been genetically modified so that it does not functionally express the MdPI or MdAP3 peptide, producing seedless

```
fruits. The DNA constructs encoding non-functional variants of Mdp1/Mdh93

may be used to transform fruiting plants, specifically apple and pear.
The polymucleotides may be used in modulating, reducing or eliminating
seed-bearing capacity in fruiting plants, used in horticulture, and in
breeding programmes to monitor the progress in breeding a stable seedless
fruiting plant. The polymucleotides may also be used in programmes for
identifying nucleic acid variants from fruiting plants. They can be used
for pre-selecting plants (mutated in Mdp1, MdAP3 or their equivalents).
They may also be used in designing programme to produce seedless fruit.
They may also be used in designing propramme to produce seedless fruit.
They may also be used in designing probes and primers for Mdp1 or MdAp3,
or their variants. The seedless fruiting plant is more convenient than seeded fruit since these can be cropped without pollination, reducing
The absence of pollen is also advantageous to alleviate environmental
concerns regarding the transfer of transgenes to non-transgenics by cross
pollination. Seedless cultivars can also avoid or reduce blennial bearing
tendencies that have been attributed to the inhibition of flower bud
formation by developing seeds and are less susceptible to codling moth
                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               240

The present sequence encodes a floral homeotic protein, designated PTD. It is derived from Populus balsamifera subsp. trichocarpa. The specification also describes PTLF, PTAG-1 and PTAG-2 proteins. The floral homeotic proteins are expressed in floral tissues. PTLF is a homologue of ILRAFY (LFY) and FLORICAULA (FLO), and is expressed in immature homologue of DEFICIENS (DEF), and is strongly expressed in stamen primordia expressed in stamen primordia expressed in stamen primordia from the onset of organogenesis. PTAG-1 and PTAG-2 are

The present sequence encodes a floral homeotic protein, designated PTD. It is derived from Populus balsamifera subsp. trichocarpa. The specification also describes PTLF, PTAG-1 and PTAG-2 proteins. The floral homeotic proteins are expressed in floral tissues. PTLF is a homologue of LEAFY (LFY) and FLORICAULA (FLO), and is expressed in immature inflorescences on which floral primordia are developing. PTD is a homologue of DEFICIRNS (DEF), and is strongly expressed in stamen primordia from the onset of organogenesis. FTAG-1 and PTAG-2 are monologues of AAAMOUS (AG). The floral homeotic proteins and polynucleotides are useful for producing transgenic plants having modified fertility characteristics, particularly sterility
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           241 AGGACACACGAGGAGTCGATGAAAGACACCTTGTGGAAGTTGAAAGAGATCAACAATAAG 300

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated nucleic acid molecule especially a protein transduction domain (PTD) promoter: (i) that hybridises under wash conditions of 0.2 x SSC (saline sodium citrate), 0.1 $5DS (sodium dodecyl sulphate) at 65 plusof to nuclectides or (ii) comprising 35 consecutive nucleotides of the PTD gene. PTD is a floral homeotic gene and is the homologue of DEFICIENS. Also includes are a recombinant of nucleic acid comprising the PTD promoter, a cell transformed with the recombinant nucleic acid and a transgenic plant comprising the recombinant nucleic acid and a transgenic plant comprising the ransformed cell. The PTD promoter is useful to obtain floral-specific expression of genes such as cytcoxins, that are employed in genetic ablation strategies to produce trees having modified fertility characteristics, including sterility. Genetic constructs comprising cantisense versions or dominant negative mutants of PTD are useful in producing genetically engineered Poplars and other trees, and for sense

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is that of cDNA encoding Populus balsamifera subsp. trichocarpa PTD protein (see AAY58654). The PTD gene (see AAZ57942) is 1 of 4 newly identified floral homeotic genes from this popular species. It is a homologue of DEFICIENS and is expressed strongly in stamen primordia from the onset of organogenesis, and is also expressed at low levels in carpel primordia. The invention provides nucleic acid sequences of these 4 Populus genes, the corresponding CDNA sequences (see AAZ57942-49) and deduced amino acid sequences (see AAX58444-57). It also provides methods of using the gene and cDNA sequences to produce genetically engineered Populus species and other trees having modified fertility characteristics, including sterility. Genetic constructs useful in producing genetically engineered Populus and other trees include

                                                                                                                                                                                                                                                                                                                        8
                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid molecule comprising at least 15 consecutive nucleotides of the gene, cDNA or coding sequence of Anometic genes from poplar, PTIF (LERFY and FLORICA homologue), PTD (DEFICIENS homologue), pTD Also included are a recombinant nucleic acid molecule comprising a promoter sequence operably linked to the nucleic acid molecule, a cell transformed with the nucleic acid molecule, a transgenic plant comprising the recombinant nucleic acid molecule, a transgenic plant comprising the recombinant nucleic acid molecule and the purified proteins encoded by the nucleic acids. The nucleic acid molecules are useful for the manipulation of flowering in Poplar and orber plant species, for producing transgenic plants and modified fertility characteristics (particularly sterility) and in the pulp and paper industries. The present sequence is the poplar PTD cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                New floral homeotic nucleic acid molecules, useful for the manipulation of flowering in Poplar and other plant species, and for producing transgenic plants having modified fertility characteristics, particularly sterility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TCCACATCGACAAAGAAGATCTACGATCAATATCAGAACGCTTTAGGCATAGATCTGTGG 240

              useful for sense suppression. Promoter sequences may be used to obtain floral specific expression of genes such as cytotoxins that may be used in genetic ablation strategies to produce trees having modified fertility characteristics, including sterrility. Sterile trees allow increased wood yield and a reduction in the production of allergens such as pollen
                                                                                                                                                                                                                                                                                                                                                               180

The present invention relates to novel plant transcription factors from Bucalyptus grandis or Pinus radiata. The present sequence is the coding sequence for one such transcription factor. The transcription factor may be used to produce a plant having modified gene expression such as a modgy plant e.g. a eucalyptus, pine, acacia, poplar, sweetgum, teak, or manogany species or to modify the activity of a polypeptide in a plant. The transcription factors of the present invention are members from the following families of regulatory proteins: bZIP, bZIP family of G-box homeotic/homeodomain/homeobox/MADS, homeodomain zipper, LIM domain, APP2 and EREBs, zinc finger domains of type 2 Cys2His2, CCAAT box elements and

New isolated polynucleotide encoding a plant transcription factor for producing a plant e.g. a woody plant, preferably eucalyptus or pine, having modified gene expression or modified activity of a polypeptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to novel floral developmental proteins, more specifically flowering locus T (FT) or ABTALA3 (AP3) homologue proteins and polymucleotides encoding such proteins. Floral developmental polymucleotides are useful for transforming calls or for producing plants by transforming the plant calls with the polymucleotides and regenerating the plant serion the transformed plant cells. Sequences of the invention are useful for immunological screening of cDNA expression libraries. They are also useful for creating transgenic plants. Polymucleotides of the invention are used as probes for genetically and physically mapping the genes that they are a part of and as markers for traits linked to those genes. AP3 homologues may be useful for engineering plant sterility or fertility, flower development and morphology. For TF11 homologues are useful for engineering time, plant growth rate, inflorescence architecture, tissue culture morphology and rate of cell division to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The homeotic gene green petal from petunia has been cloned and characterised previously. The gene was used in a new method for controlling the morphogenesis of plant organs comprising regulating the expression of the gene using ectopic expression. Such a method can be used to determine and control plant organ morphogenesis, such as modifying petals without altering the reproductive portions of the flower. See also AAQ51190-1. ```
The present invention relates to novel floral developmental proteins, more specifically flowering locus T (FT) or APETALA3 (A23) homologue proteins and polymucleotides encoding such proteins. Floral developmental polymucleotides are useful for transforming cells or for producing plants by transforming the plant cells with the polymucleotides and regenerating the plants from the transformed plant cells. Sequences of the invention are useful for reating transgenic plants. Polymucleotides of the invention are used as probes for genetically and physically mapping the genes that they are a part of and as markers for traits linked to those genes. AP3 homologues may be useful for engineering plant sterility or fertility, flower development and morphology. FT or TFL1 homologues are useful for engineering flowering time, plant growth rate, inflorescence architecture, tissue culture morphology and rate of cell division to enhance transformation. The present sequence is corn AP3 homologue cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New floral developmental polypeptide having flowering locus T or Ap3 homolog activity, useful for immunological screening of cDNA expression
                                                                  Floral developmental protein; flowering locus T; APETALA3; transgenic; FT; AB3; transgenic plant; fertility; flower development; gene mapping; sterility; plant growth; inflorescence architecture; plant morphology; tissue culture; cell division; corn; gene; ss.

```

The present invention relates to novel plant transcription factors from becalyptus grandias or Pinus radiata. The present sequence is the coding sequence for one such transcription factor. The transcription factor may be used to produce a plant having modified gene expression such as a woody plant e.g. a eucalyptus, pine, acadia, poplar, sweetgum, teak, or mahogany species or to modify the activity of a polypeptide in a plant. The transcription factors of the present invention are members from the following families of regulatory proteins: bZIP, bZIP family of G-box binding factors, basic helix-loop-halix zipper, bind domain, AP2

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
